

Marryat

LARGE ARBOR

The *Marryat Large Arbor Reel* is a new design that includes features not found in other large arbor reels.

- Quick-change of drag tension when fighting fish; little start-up inertia, linear drag settings
- Perfect, lightweight rod balance resulting from unique reel balance
- Double housing mechanism to protect mechanical parts

Special features make the reel compact, lightweight, yet strong.

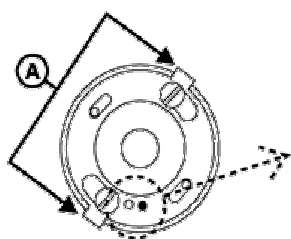

- Mechanical parts are housed within the arbor.
- The click-sound mechanism uses the housing's inner wall.
- Concave/convex gears reduce thickness.
- Dual ring frame is very strong.

Feature **The reel is lightweight, despite being a large arbor reel.**

The frame has been trimmed of excess material to leave only the necessary reinforced structure without sacrificing structural strength. Notice that the spool has also been trimmed, reducing its weight as much as possible. As a result, an overall light weight has been achieved.

Feature **The reel can be changed quickly to either right-hand or left-hand use.**

Marryat is the first in the world to introduce a mechanism for changing the clutch instantly. Simply turn the disk by pushing on the tabs marked A with the tips of your fingers until the projection moves to either "R" or "L". No screws, no tools, no flipping of parts, no lost parts!

Feature **The handle is functional and easy to use.**

The handle is 10mm in diameter and 20.5mm in length, an ergonomic size. The handle has a non-glossy finish reducing slippage caused by wet hands. Plastic is the material of choice because it is comfortable to the touch, but most importantly, because it is durable.

Feature **The large drag knob together with the proven drag system enables quick and precise adjustment.**

The Roller Clutch Brake System is a drag system developed by **Marryat** over two decades ago. It is a proven design which has become very popular with anglers all over the world. The system has been adopted for the Marryat Large Arbor Reel.

The drag can be adjusted to any strength in a broad range. The large drag adjustment knob is streamlined in appearance yet perfectly shaped to allow the finest adjustments rapidly. At low settings the drag is near zero. At higher ranges the drag operates in a totally linear fashion within range with little start-up inertia. This allows the ability to fish fine tippets with confidence and still have big fish stopping power.

Feature **The double brake housing protects all the important mechanical parts.**

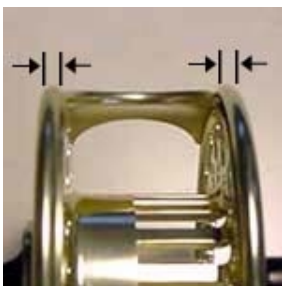

The brake housing protects the entire drag mechanism against impact and infiltration of dust or other alien substances.

Notice that the click-sound mechanism uses the inner wall which reduces weight without sacrificing durability.

The brake housing and the brake mechanism fit inside the spool housing. This gives the effect of a double housing around the drag mechanism for maximum durability and protection of internal parts. This feature is only possible with a large arbor reel.

Feature **The reel is crafted to balance nicely with your rod for a fatigue-free casting position.**

The spool and body rims have the same thickness to improve the overall balance of the reel. Reel balance has been further improved by housing the brake mechanism inside the large arbor. These features place the center of gravity directly under the rod. Thus the reel is weight compensated for maximum comfort. This means that your hand does not have to support a reel that always wants to be canted thereby reducing fatigue.

This careful attention to the overall balance of the reel is a big aid to pinpoint casting.

Available in Light Gold and Metallic Grey in 3 sizes. Sizes are for line weights 3/4, 5/6, 8/9.

The Marryat Large Arbor Reel comes in a neoprene reel bag that has an eye-catching color. Guaranteed to stand out against any background. You won't misplace your reel ever again!
